

## Conrad iOS Test Project

Please write a small iPhone app. It should include two scrollable pages and a navigation bar to indicate the current page. The user should be able to swipe left and right to switch between the pages.

Please including a nice animation when swiping from left to right (like i.e. in the photos app). And the navigation bar in our example looks really crappy as well and of course our customers would love to see something fancy there.

For the data please parse the json from here (<http://www.androidbegin.com/tutorial/jsonparsetutorial.txt>) and pick any of the countries to display initially. Display the flag as image and fill in something suitable for title and description.

When hitting the button on page2 please automatically swipe back to page1 and display a different randomly selected country.

In general, you are free in any way to improve the design, colors, project setup and so on as we are always open for good suggestions. Please use a current version of XCode / the iOS frameworks. Whether you use Swift or iOS 8 is up to you.

After having finished commit everything into a GIT-Repository and send us the whole project as ZIP-file. If you have questions – let us know or make a conscious decision and move forward alone.
